Design and Analysis of Algorithm

Dynamic Programming (0/1 knapsack problem, All pair shortest path)

Lecture – 54-56

Overview

- Dynamic Programming is a general algorithm design technique for solving problems defined by recurrences with overlapping subproblems
- Invented by American mathematician "Richard Bellman) in the year 1950s to solve optimization problems and later assimilated by Computer Science.
- "Programming" here means "planning"

- "Method of solving complex problems by breaking them down into smaller sub-problems, solving each of those sub-problems just once, and storing their solutions."
- The problem solving approach looks like Divide and conquer approach.(which is not true)

Difference between Dynamic programming and Divide and Conquer approach.

Divide & Conquer	Dynamic Programming
Partitions a problem into independent smaller sub-problems	Partitions a problem into overlapping sub-problems
Doesn't store solutions of sub- problems. (Identical sub-problems may arise - results in the same computations are performed repeatedly.)	Stores solutions of sub- problems: thus avoids calculations of same quantity twice
3. Top down algorithms: which logically progresses from the initial instance down to the smallest sub-instances via intermediate sub-instances.	3. Bottom up algorithms: in which the smallest sub-problems are explicitly solved first and the results of these used to construct solutions to progressively larger sub-instances

Is a Four-step methods

- 1. Characterize the structure of an optimal solution.
- 2. Recursively define the value of an optimal solution.
- 3. Compute the value of an optimal solution, typically in a bottom-up fashion.
- 4. Construct an optimal solution from computed information.

Problems:

- 1. 0/1 Knapsack Problem
- 2. Floyd-Warshall Algorithm
- 3. Matrix Chain Multiplication
- 4. Longest Common Sub-sequence

Problem 1: 0/1 Knapsack Problem

- As the name suggests, items are indivisible here.
- We can not take the fraction of any item.
- We have to either take an item completely or leave it completely.
- It is solved using dynamic programming approach.

Lets solve with four step methods:

Problem 1: 0/1 Knapsack Problem

Step 1: Characterize the structure of an optimal solution

Let there are n number of objects, their profit values are $\langle v_1, v_2, v_3, \dots, v_n \rangle$, weight are $\langle w_1, w_2, w_3, \dots, w_n \rangle$. The maximum capacity of Knapsack is "M".

The 0/1 knapsack problem can states as follows

Maximize $\sum_{i=1}^{n} v_i x_i$ (i.e. sum of the profit should be maximize)

Subject to $\sum_{i=1}^{n} w_i x_i \le M$ (i.e. Sum of the weights should be less than or equal to capacity of the bag.)

Where, $x_i \in \{0,1\}$

Problem 1: 0/1 Knapsack Problem

Step 2: Recursively define the value of optimal solution.

```
Let c[i,j] is an two dimensional array, where i=0,1,2,\ldots,n (i.e. number of objects) j=0,1,2,\ldots,M (i.e. maximum weight of knapsack) Then c[i,j] = \begin{cases} 0 & \text{if } i=0 \ \& j=0 \\ c[i-1,j] & \text{if } 0 \le w_i > j \\ \max(c[i-1,j],c[i-1,j-w_i]+v_i) & \text{if } i>0 \ \& j \ge w_i \end{cases}
```

Problem 1: 0/1 Knapsack Problem

Step 3: Compute optimal solution for 0/1 knapsack problem. 0/1 Knapsack (v, w, n, M)

```
1. For j = 0 to M

2. C[0,j] = 0

3. keep[0,j] = 0

4. For i = 1 to n

5. For j = 0 to M

6. if (j \ge w[i]) \& (c[i-1,j-w[i]] + v[i]) > c[i-1,j])

7. then c[i,j] = c[i-1,j-w[i]] + v[i]

8. keep[i,j] = 1

9. else c[i,j] = c[i-1,j]

10. keep[i,j] = 0

11. Return c[n, M]
```

Problem 1: 0/1 Knapsack Problem (Implementation)

Consider-

Knapsack weight capacity = w
Number of items each having
some weight and value = n
0/1 knapsack problem is solved using
dynamic programming in the following
steps-

Step-01:

- Draw a table say 'c' with (n+1) number of rows and (w+1) number of columns.
- Fill all the boxes of 0th row and 0th column with zeroes as shown in figure

0	1	2	3		W
1	0	0	0	•••	0
2	0				
3	0				
n	0				

Problem 1: 0/1 Knapsack Problem

Step-02:

 Start filling the table row wise top to bottom from left to right by using the following formula-

$$c(i,j) = \max\{c(i-1,j),c(i-1,j-w_i)+v_i\}$$

- Here, $c(i,j) = \text{maximum value of the selected items if we can take items 1 to i and have weight restrictions of j.$
- This step leads to completely filling the table.
- Then, value of the last box represents the maximum possible value that can be put into the knapsack.

Problem 1: 0/1 Knapsack Problem

Step-03:

- To identify the items that must be put into the knapsack to obtain that maximum profit, Consider the last column of the table.
- Start scanning the entries from bottom to top.
- On encountering an entry whose value is not same as the value stored in the entry immediately above it, mark the row label of that entry.
- After all the entries are scanned, the marked labels represent the items that must be put into the knapsack.

Problem 1: 0/1 Knapsack Problem

Item	Weight	Profit
1	2	1
2	3	2
3	4	5
4	5	6

Problem 1: 0/1 Knapsack Problem

			0	1	2	3	4	5	6	7	8

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

As two possible weight are available (i.e. 3 and 5)

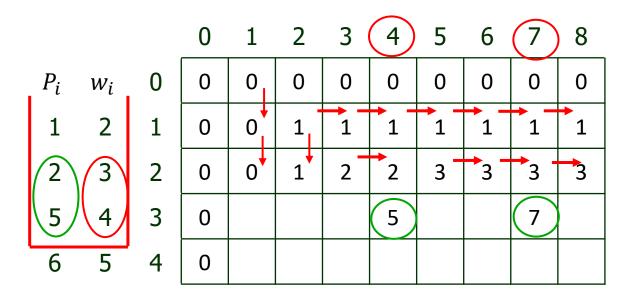

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

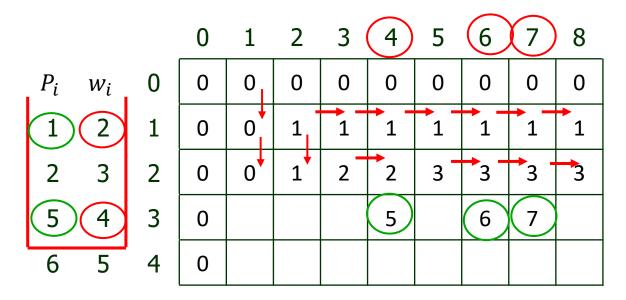

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

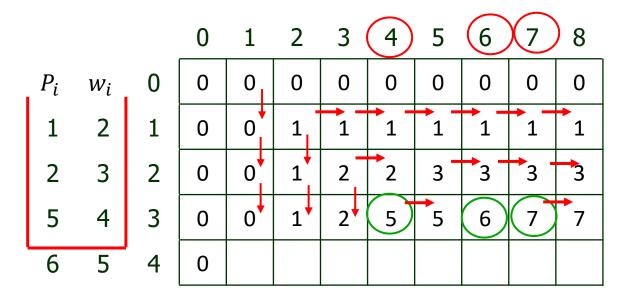

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

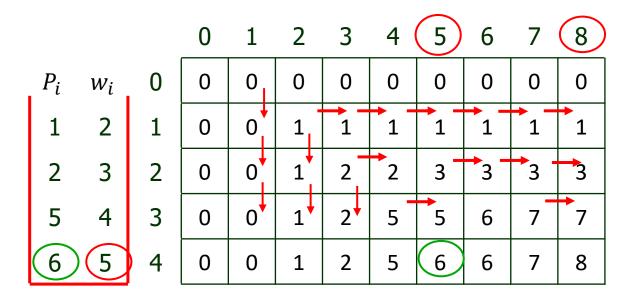

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

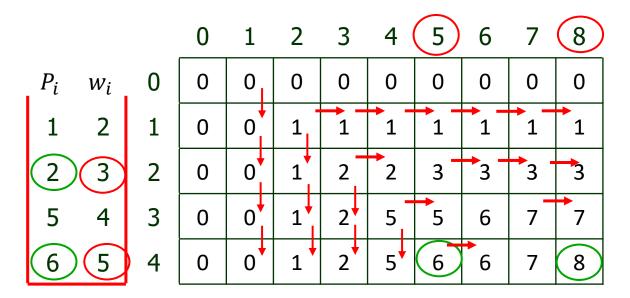

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

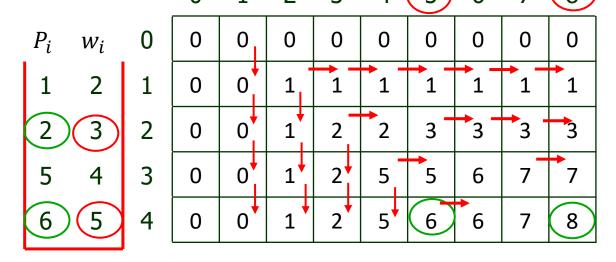

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

Apply the following formula for calculating the C Table

$$c(i,j) = \max\{c(i-1,j),c(i-1,j-w_i)+v_i\}$$

Problem 1: 0/1 Knapsack Problem

Step 4: Construct / print the optimal solution of 0/1 knapsack problem.

0/1 Knapsack solution(n, M)

- 1. k = M
- 2. For i = n down to 1
- 3. if (keep[i,k] == 1)
- 4. then print i
- 5. k = k w[i]

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

			0	1	2	3	4	5	6	7	8	
P_i	w_i	0	0	0	0	0	0	0	0	0	0	
1	2	1	0	0	1	1	1	1	1	1	1

5	4	3	0	0	0	0	1	1	1	1	1	
6	5 (4	0	0	0	0	1	1	0	0		

Keep array

Problem 1: 0/1 Knapsack Problem

Example 1: For the given set of items and knapsack capacity of 8 kg, find the optimal solution for the 0/1 knapsack problem making use of dynamic programming approach.

			0	1	2	3	4	5	6	7	8	
P_i	w_i	0	0	0	0	0	0	0	0	0	0	
1	2	1	0	0	1	1	1	1	1	1	1	
2	3	2	0	0	0	1	1	1	1	1	1	
5	4	3	0	0	0	0	1	1	1	1	1	
6	5	4	0	0	0	0	1	1	0	0		

Keep array

Problem 1: 0/1 Knapsack Problem (Complexity)

Time complexity of 0/1 Knapsack problem is $\mathcal{O}(nM)$. where, n is the number of items and M is the capacity of knapsack.

Problem 2: Floyd-Warshall Algorithm

- The all pair shortest path problem is the problem of finding a path between two vertices or nodes in a graph such that the sum of the weights of its constituents edges is minimized.
- This problem is also known as All pair shortest path problem.
- Floyd-Warshall Algorithm is an example of dynamic programming approach.
- The advantages of Floyd-Warshall Algorithm are:
 - Easy to implement and extremely simple.

Problem 2: Floyd-Warshall Algorithm (Requirements)

- Graph must be weighted directed graph.
- Edge weights can be positive or negative.
- There should be no negative cycle.
 - (A negative cycle is a cycle whose edges sum give a negative value)
- This algorithm is best suited for dense graphs because, it's complexity depends on the number of vertices in the given graph

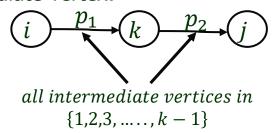

Problem 2: Floyd-Warshall Algorithm (Algorithm)

- Graph must be weighted directed graph.
- Edge weights can be positive or negative.
- There should be no negative cycle.
 - (A negative cycle is a cycle whose edges sum give a negative value)
- This algorithm is best suited for dense graphs because, it's complexity depends on the number of vertices in the given graph

Problem 2: Floyd-Warshall Algorithm

Step 1: Characterize the structure of an optimal solution

- For path $p = \langle v_1, v_2, v_3, \dots, v_l \rangle$, an intermediate vertex is any vertex of p other than v_1 to v_l .
- Let d_{ij}^k =shortest path weight of any path $i \sim j$ with intermediate vertices in $\{1,2,3,\ldots,k\}$.
- Consider a shortest path $i \sim j$ with all intermediate vertices in $\{1,2,3,\ldots,k\}$:
 - If k is not an intermediate vertex, then all intermediate vertices of p are $\{1,2,3,\ldots,k-1\}$.
 - If k is an intermediate vertex:

Problem 2: Floyd-Warshall Algorithm

Step 2: Recursively define the value of optimal solution.

$$d_{ij}^{k} = \begin{cases} w_{ij} & \text{if } k = 0\\ \min(d_{ij}^{k-1}, d_{ik}^{k-1} + d_{kj}^{k-1}) & \text{if } k \ge 1 \end{cases}$$

Because for any path, all intermediate vertices are in the set $\{1,2,3,\ldots,n\}$, the matrix $D^n=d^n_{ij}$ give the final answer:

$$d_{ij}^n = \sigma(i,j), \quad for \, all \, i,j \in V$$

Problem 2: Floyd-Warshall Algorithm

Step 3: Compute optimal solution for 0/1 knapsack problem. $Floyd_warshall(w)$

```
1. n = w.rows

2. D^0 = w

3. For k = 1 to n

4. let D^k = d^k_{ij} be an new n \times n matrix

5. For i = 1 to n

6. For i = 1 to n

7. d^k_{ij} = \min(d^{k-1}_{ij}, d^{k-1}_{ik} + d^{k-1}_{kj})

8. Return D^n
```

Problem 2: Floyd-Warshall Algorithm

Step 4: Construct / print the optimal solution of 0/1 knapsack problem.

- Need to calculate predecessor matrix Π from the weight matrix D.
- Compute Π at the same time with D.
- Recursively calculate Π_{ij}^k

•
$$\Pi_{ij}^{0} = \begin{cases} NULL & \text{if } i = j \text{ or } w_{ij} = \infty \\ i & \text{if } i \neq j \text{ or } w_{ij} = \infty \end{cases}$$

•
$$\Pi_{ij}^{k} = \begin{cases} \Pi_{ij}^{k-1} & \text{if } d_{ij}^{k-1} \leq d_{ik}^{k-1} + d_{kj}^{k-1} \\ \Pi_{kj}^{k-1} & \text{if } d_{ij}^{k-1} > d_{ik}^{k-1} + d_{kj}^{k-1} \end{cases}$$

Problem 2: Floyd-Warshall Algorithm

Step 4: Construct / print the optimal solution of 0/1 knapsack problem.

$Floyd_warshall(w)$

```
1. n = w.rows

2. D^0 = w

3. Init\_predeecessors (\Pi^0)

4. For k = 1 to n

5. For i = 1 to n

6. For j = 1 to n

7. if(d_{ij}^{k-1} \le d_{ik}^{k-1} + d_{kj}^{k-1})

8. d_{ij}^k = d_{ij}^{k-1} \quad and \quad \Pi_{ij}^k = \Pi_{ij}^{k-1}

9. else \quad d_{ij}^k = d_{ik}^{k-1} + d_{kj}^{k-1} and \quad \Pi_{ij}^k = \Pi_{kj}^{k-1}

10. Return D^n \text{ and } \Pi^n
```

Problem 2: Floyd-Warshall Algorithm

Step 4: Construct / print the optimal solution of 0/1 knapsack problem.

```
Print\_all\_pairs\_shortest\_path(\Pi, i, j)
```

```
1. If (i = j)

2. then print i

3. else if \Pi_{ij} = Null

4. then print "No path from i to J"

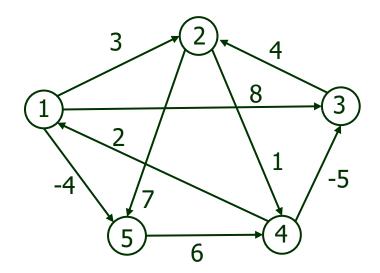

5. else

6. Print_all_pairs_shortest_path(\Pi, i, \Pi_{ij})

7. print j
```

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Using Floyd-Warshall Algorithm, find the shortest path distance between every pair of vertices.

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

Step-01:

Remove all the self loops and parallel edges (keeping the lowest weight edge) from the graph.

In the given graph, there are neither self edges nor parallel edges.

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

Step-02:

- Write the initial distance matrix.
- It represents the distance between every pair of vertices in the form of given weights.
- For diagonal elements (representing self-loops), distance value =
 0.
- For vertices having a direct edge between them, distance value = weight of that edge.
- For vertices having no direct edge between them, distance value $= \infty$.

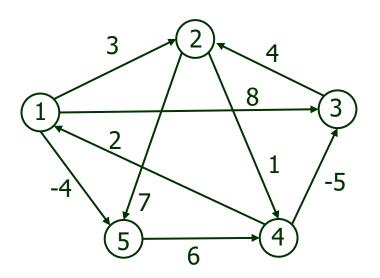

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

Step-02:

Initial distance matrix for the given graph is-

		1	2	3	4	5

2	4	Z	4	2	1
3	4	3	Ζ	2	1
4	4	3	4	Z	1
5	4	3	4	5	N

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Z	3	4	5	1
2	4	Z	4	2	1
3	4	3	Z	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Ν

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.E $Print_all_pairs_shortest_path(\Pi, 1, 2)$

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Z	3	4	5	1
2	4	Z	4	2	1
3	4	3	Z	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Ν

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

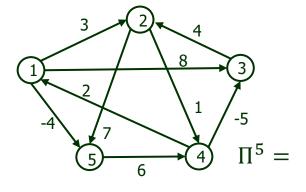

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Z	4	2	1
3	4	3	Ν	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Z

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 4)

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Z	4	2	1
3	4	3	Ν	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Ν

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 5)

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Z	4	2	1
3	4	3	Ν	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Z

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 5)

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 1)

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Z	3	4	5	1
2	4	Z	4	2	1
3	4	3	Ν	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Ν

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 5)

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Z	4	2	1
3	4	3	Z	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Z

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4)

ightharpoonupPrint_all_pairs_shortest_path(Π , 1, 5) \Rightarrow 5

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	N	3	4	5	1
2	4	Z	4	2	1
3	4	3	Z	2	1
4	4	ന	4	Z	1
5	4	თ	4	5	Z

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3)

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4) \Rightarrow 4

ightharpoonupPrint_all_pairs_shortest_path(Π , 1, 5) \Rightarrow 5

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Z	4	2	1
3	4	3	Ν	2	1
4	4	3	4	Ζ	1
5	4	3	4	5	Z

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2)$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3) \Longrightarrow 3

 \rightarrow Print_all_pairs_shortest_path(Π , 1, 4) \Rightarrow 4

 \rightarrow Print_all_pairs_shortest_path $(\Pi, 1, 5) \Rightarrow 5$

Problem 2: Floyd-Warshall Algorithm

Example 1: Consider the following directed weighted graph-

Solution:

	1	2	3	4	5
1	Ν	3	4	5	1
2	4	Ν	4	2	1
3	4	3	Z	2	1
4	4	3	4	Ν	1
5	4	3	4	5	Ν

For printing Shortest path from 1 to 2 use

 $Print_all_pairs_shortest_path(\Pi, i, j)$

i.e $Print_all_pairs_shortest_path(\Pi, 1, 2) \Rightarrow 2$

 \longrightarrow Print_all_pairs_shortest_path(Π , 1, 3) \Longrightarrow 3

ightharpoonup Print_all_pairs_shortest_path(Π , 1, 4) \Longrightarrow 4

 \rightarrow Print_all_pairs_shortest_path $(\Pi, 1, 5) \Rightarrow 5$

Problem 2: Floyd-Warshall Algorithm (Analysis)

- 1. Floyd-Warshall Algorithm consists of three loops over all the nodes.
- 2. The inner most loop consists of only constant complexity operations.
- 3. Hence, the asymptotic complexity of Floyd Warshall algorithm is $O(n^3)$.
- 4. Here, n is the number of nodes in the given graph.
